Lab 1. Working environment

Departamento de
Lenguajes y Sistemas Informáticos

UNIVERSIDAD D SEVILLA

Pieces of a development environment

- Servers
- Project Management Software
  - Collaboration Software
- Version Control Systems
- Bug Tracker Software

Servers

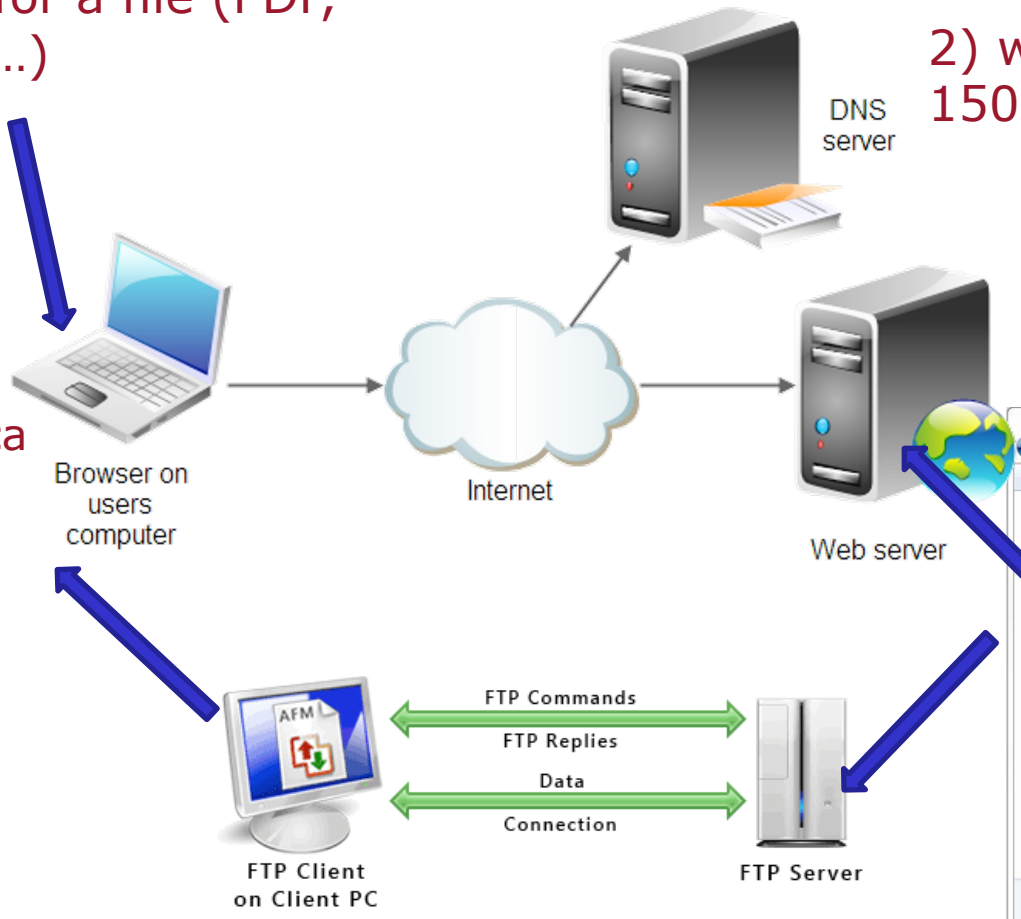

- We usually need:
  - Web Server: Apache
  - Data Base Server: MySQL
- PHP Web Servers Installers
  - XAMP (WAMP, LAMP, MAMP): **W**indows/**L**inux/**M**acOS – **A**pache **M**ySql **P**hp

Servers

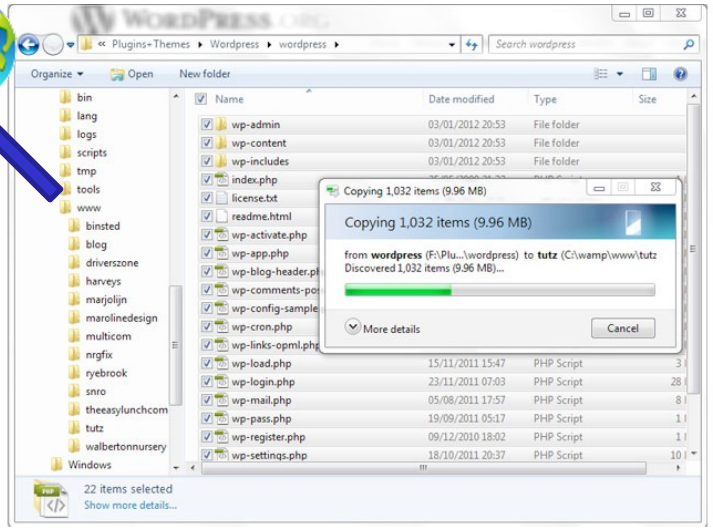

1) Web browser asks for a file (PDF, PNG,…)

2) www.us.es = IP: 150.214.80.45

ADSL = IP Dinámica

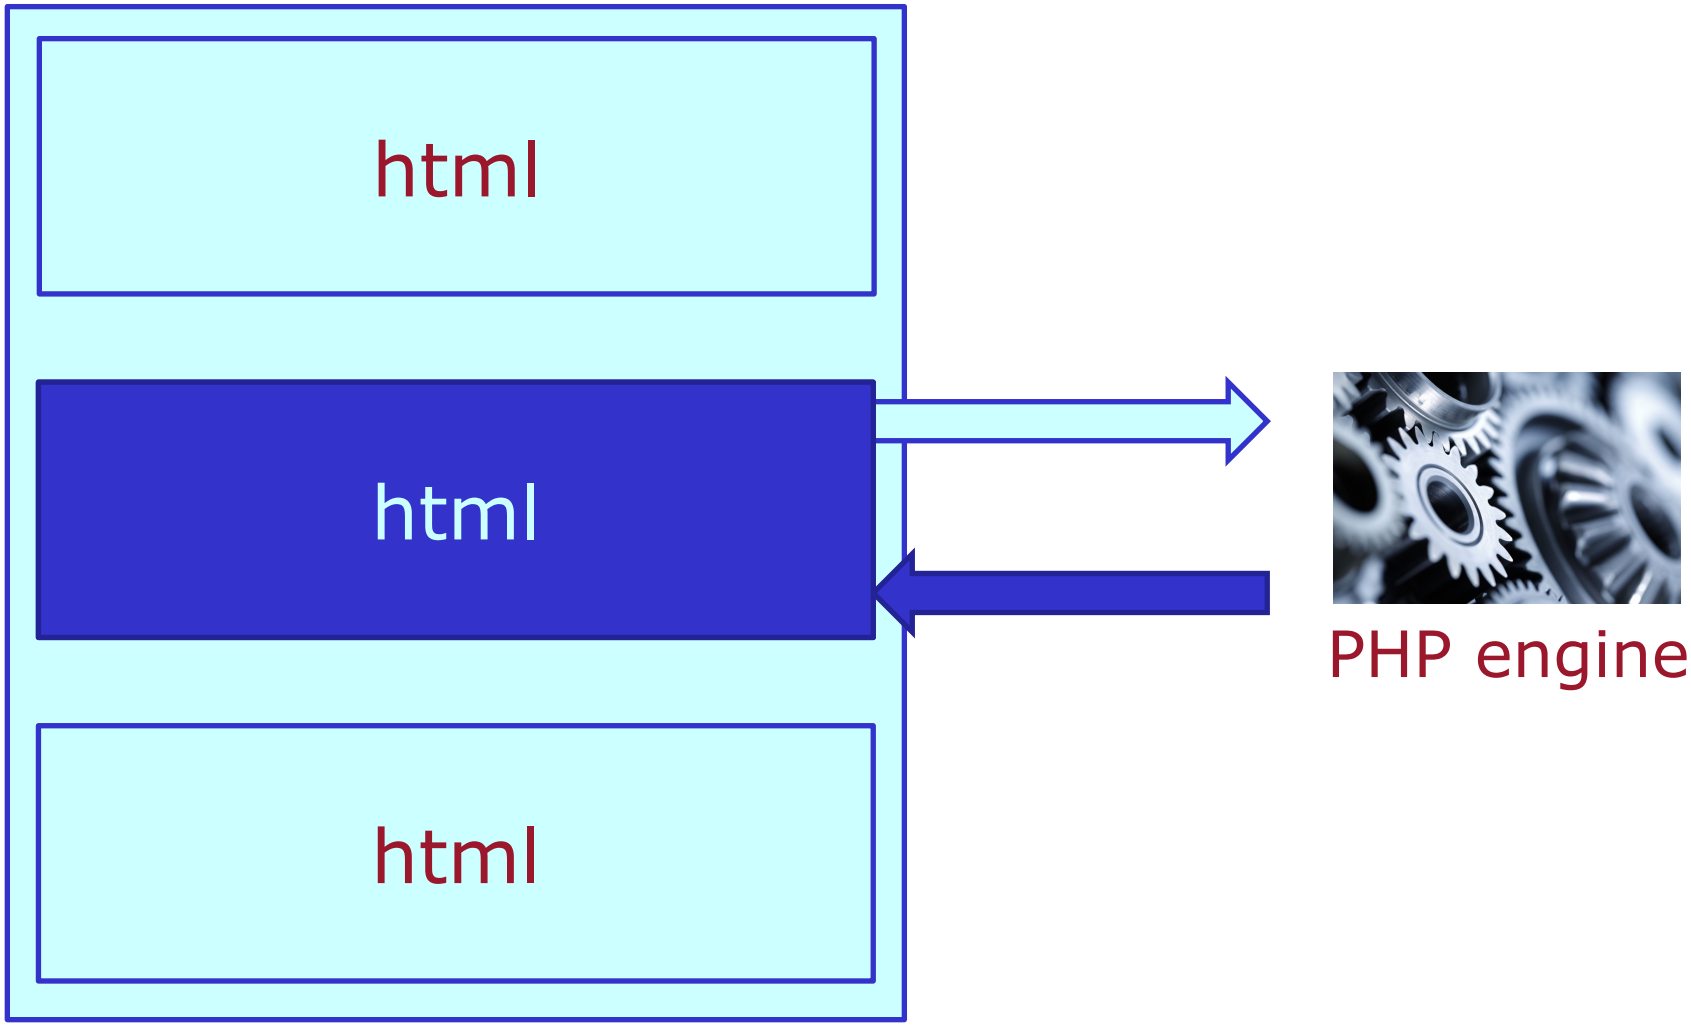

3) Server executes PHP code and returns HTML code

4) An FTP server returns the file

Code on the server side

Project Management Software

- Software for **SCRUM**
  - You have to decide which one to use
- Many free online systems supporting SCRUM
  - Trello.com
  - Jira
  - Github projects
- You must submit **in every deliverable**
  - Project backlog
  - Sprint backlog
  - **Burndown chart**

Collaboration Software

- A lot of software for working collaboratively
  - Teams
  - Trello
  - To Do
  - Google Drive
  - Telegram / Whatsapp
  - Discord / Slack
  - Many other options.

- Determine your needs, see **comparisons** and decide your working environment

Collaboration Software

- **Centralized Workspaces:** Integrate instant messaging, video conferencing, and file sharing in a single hub.
- **Asynchronous & Synchronous Communication:** Reduces the need for unnecessary in-person meetings.

Version Control Systems

- For managing code collaboratively. E.g:
  - CSS, PHP, etc.
- Projetsii
- Github / BitBucket/ Redmine / Subversion
- Detect conflicts between developers
- Detect differences between versions
- Mandatory for maintaining evolving software

Bug Tracking Software

- Communication with the customer
  - Customer adds bugs, and developers solve them
- Open source E.g.: Mantis, Jira
- Online systems: UserEcho.com
- Not needed in his course

Group Tasks

- Groups must decide **their own working environment** justifying their decisions
  - Collaborative software
  - Software for SCRUM
  - Version control software
- Every group must follow **SCRUM**, plan the sprints, and show the burndown in every deliverable
- Well chosen working environments and their correct and frequent use will benefit the final grade of the subject

Group Tasks

- Think of the software you'll use for:
  - Drawing class diagrams
  - Drawing mockups
  - Next week you'll start using them!

Group Tasks

- Install WAMP/LAMP/MAMP/XAMP
- Install REMUS
- No deliverable this week
- Next week: Wordpress

- **Don't forget this!!** This subject requires research work from students, you'll have to read a lot and learn to manage the different environments on your own

Download W/L/M-AMP

WAMP

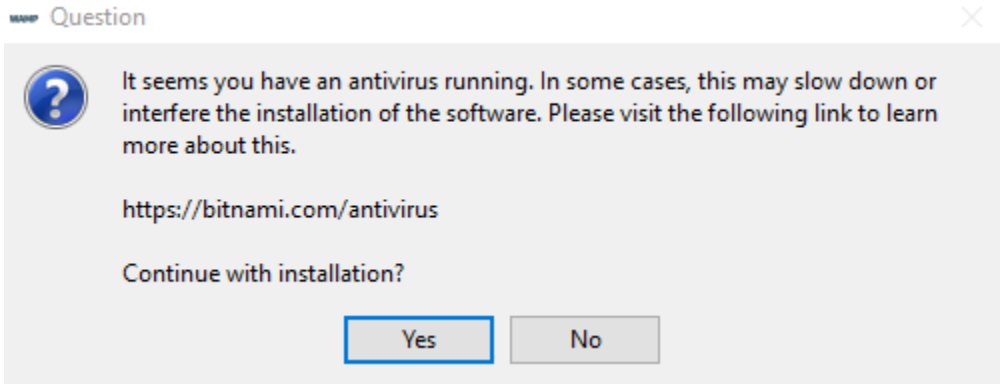

MAMP

LAMP

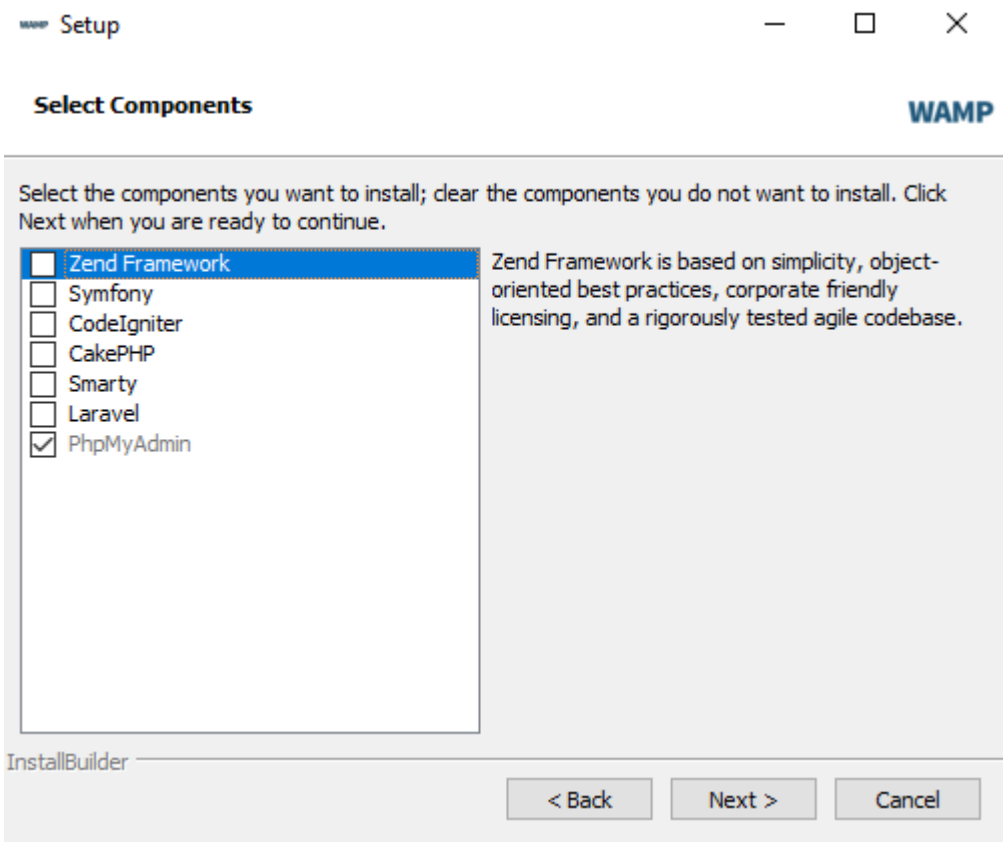

Installing WAMP

- You may need to disable the antivirus

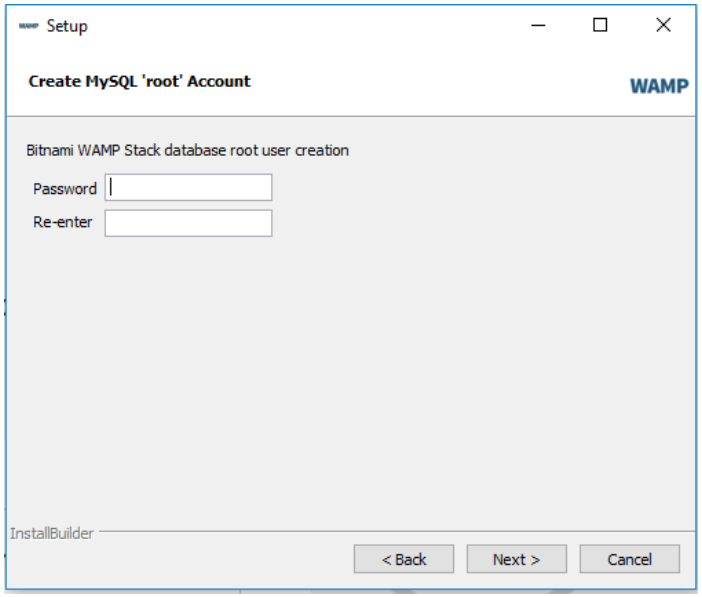

Installing WAMP

- We won't need any module

Installing WAMP

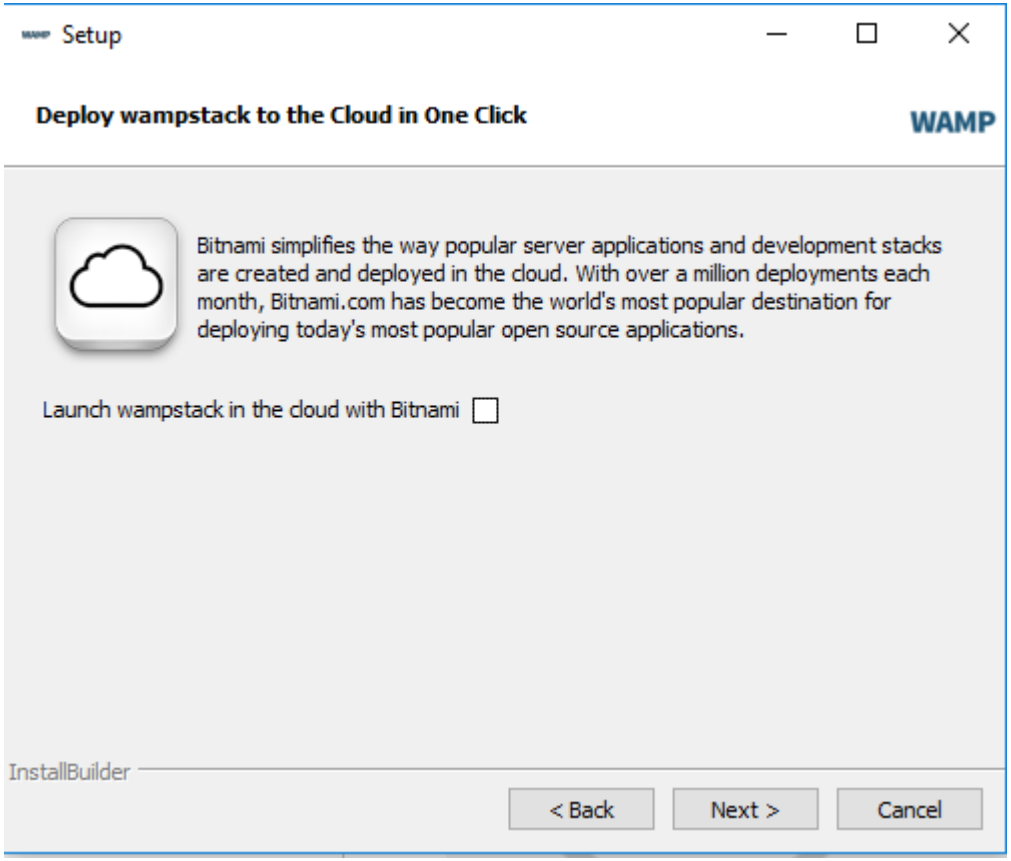

- When installing, you may need to enter a password for accessing the database as root user ➔ WRITE IT DOWN, DON'T FORGET IT!!

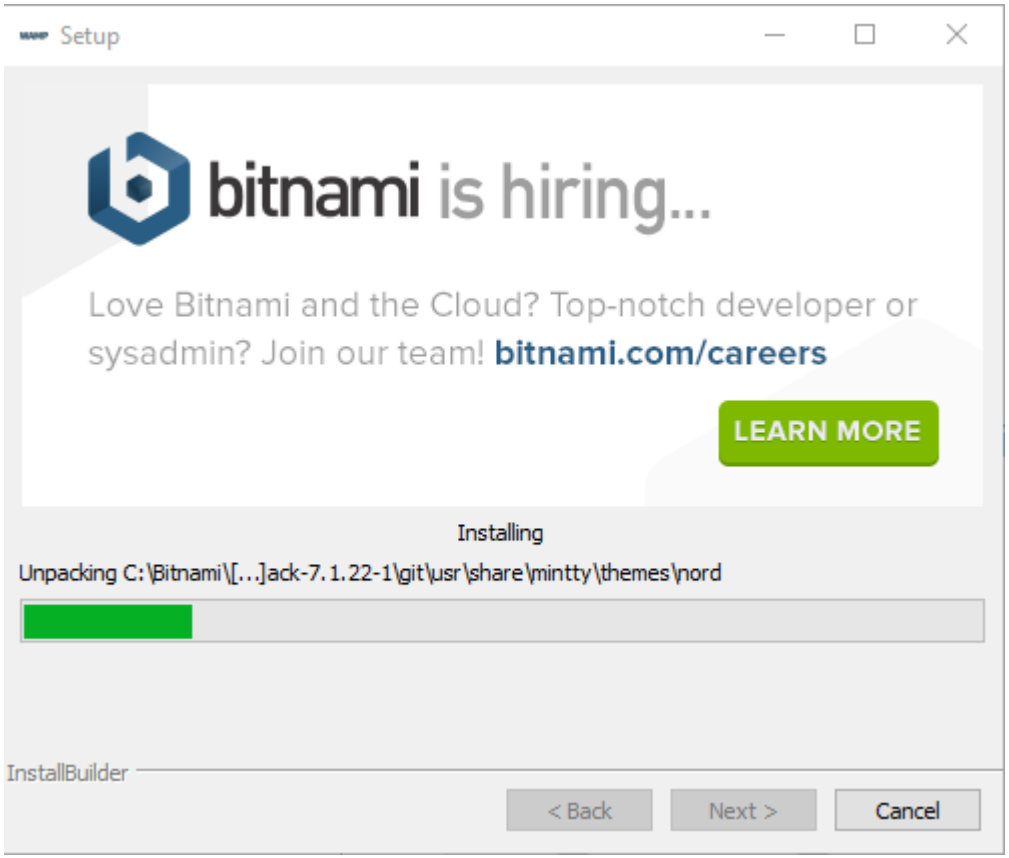

- In other installations, this step may be skipped and default values are used

Installing WAMP

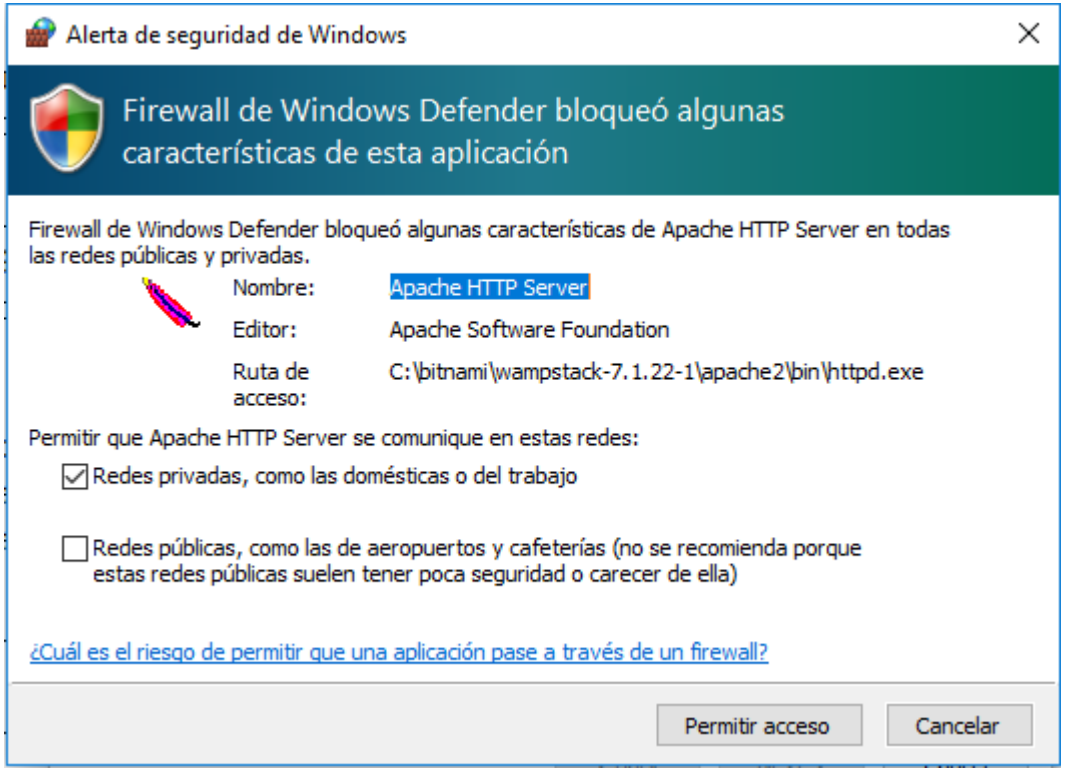

- We will be working locally

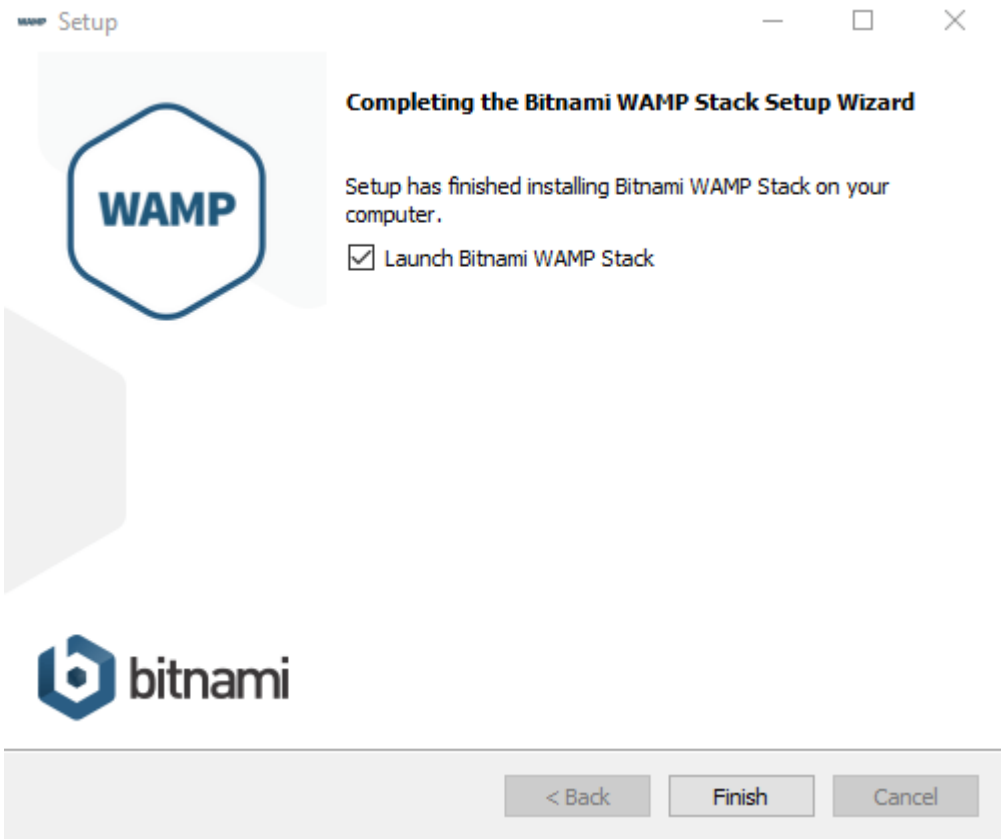

Installing WAMP

Installing WAMP

Installing WAMP

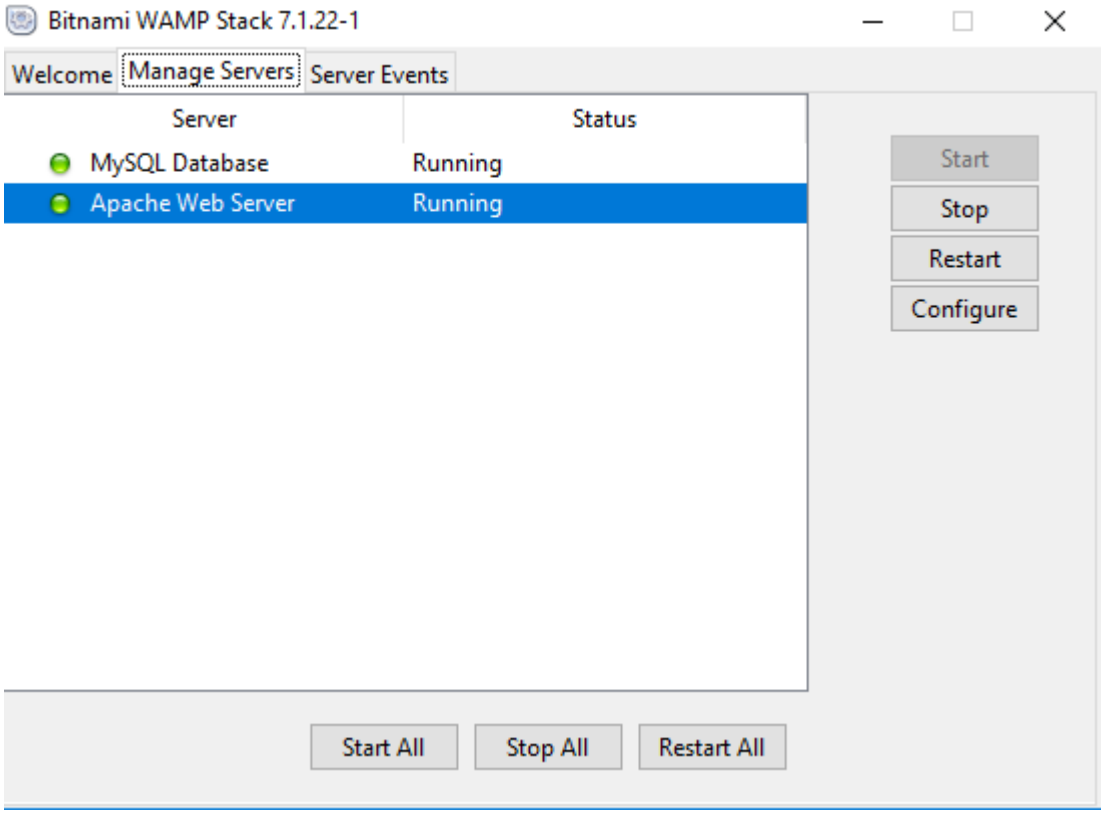

WAMP

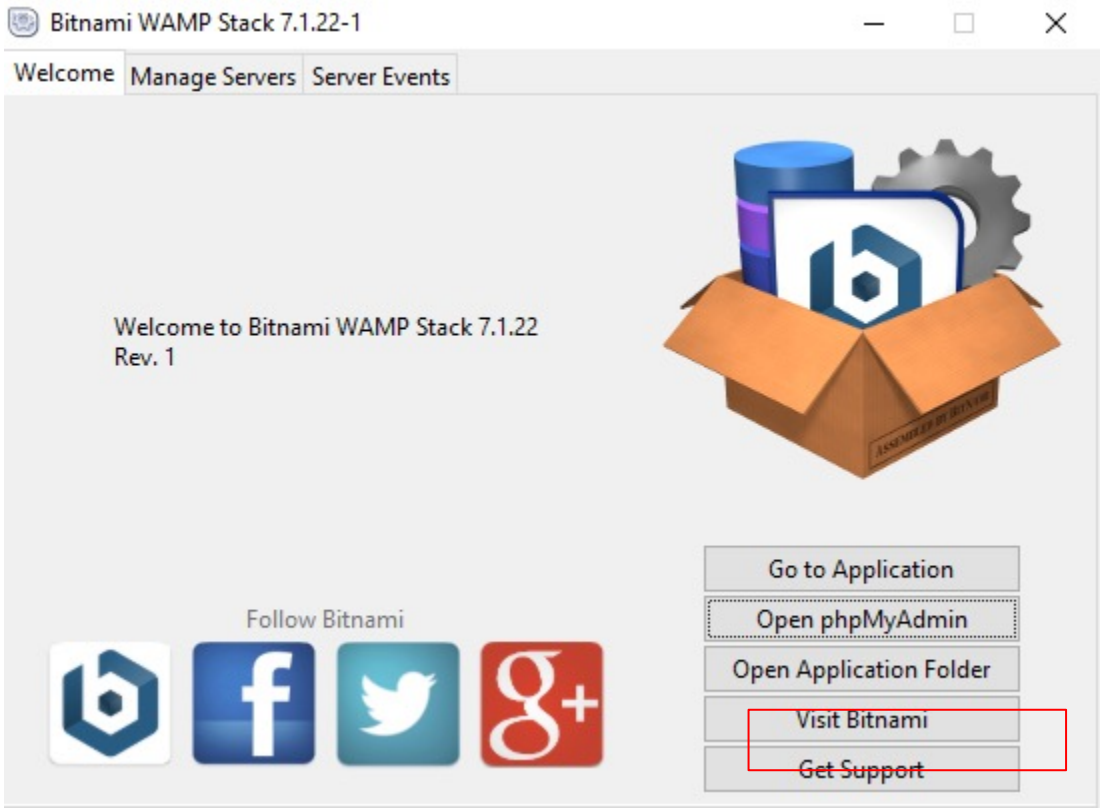

Bitnami WAMP Stack 7.1.22-1

Welcome to Bitnami WAMP Stack 7.1.22
Rev. 1
Follow Bitnami
Go to Application
Open phpMyAdmin
Open Application Folder
Visit Bitnami
Get Support

phpMyAdmin

- Introduce credentials
  - User: root
  - Password: created during installation

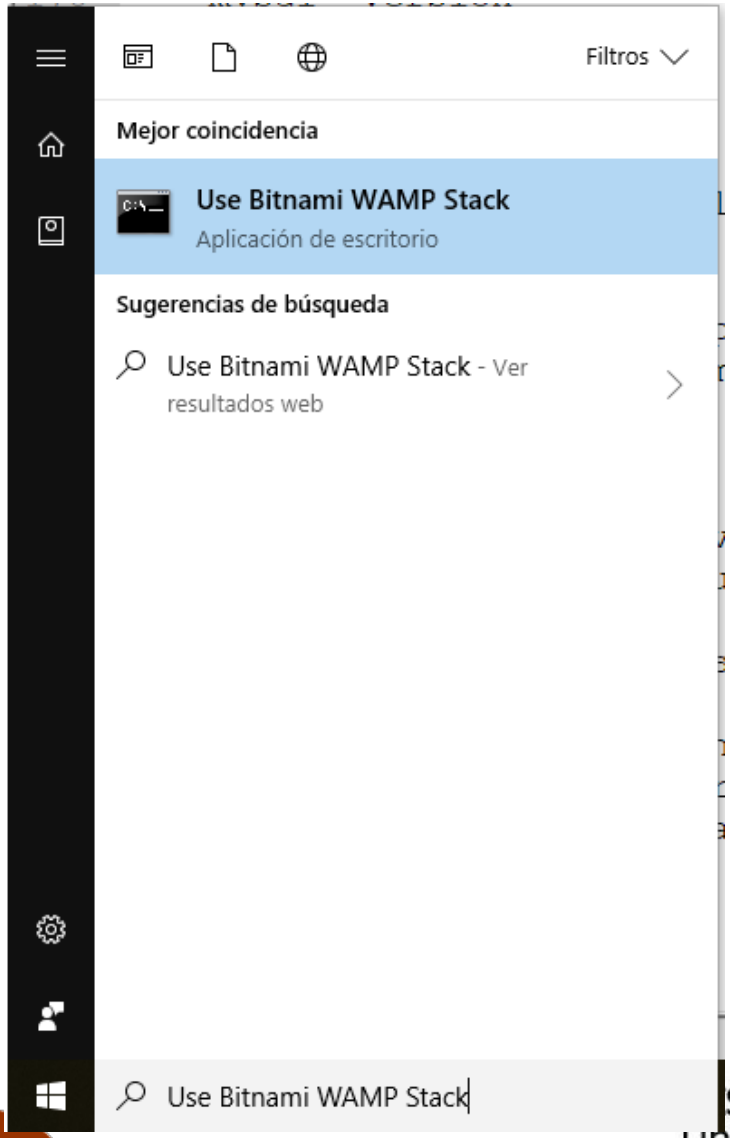

phpMyAdmin

- Admin panel
  - Task: play a bit with it
  - We'll see more in next lab

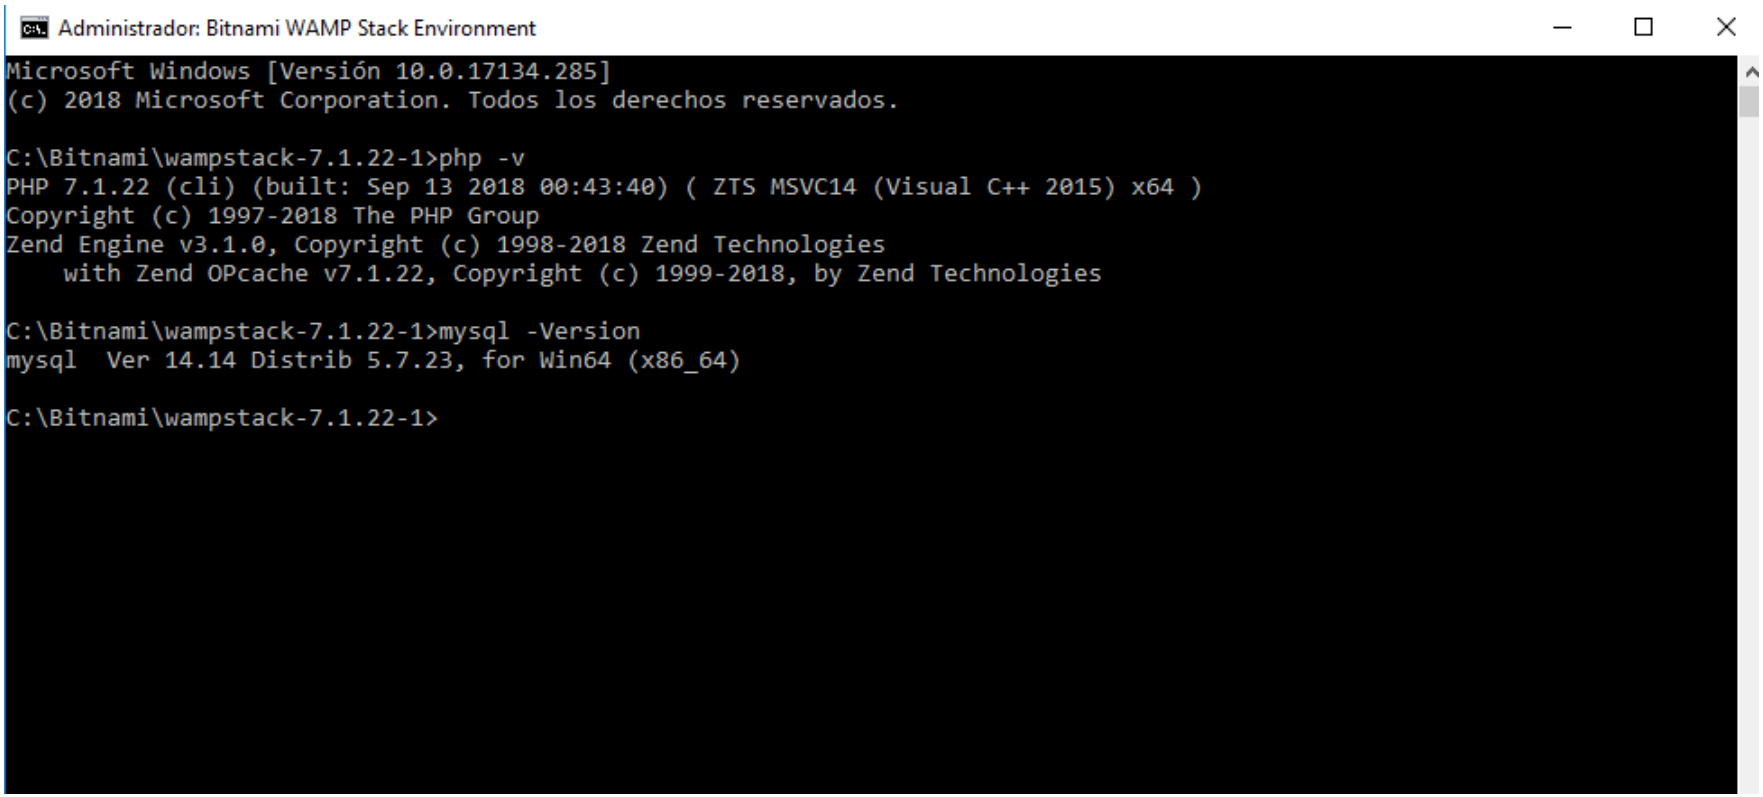

Checking PHP and MySQL versions

Checking PHP and MySQL versions

- php –v
- mysql –Version

Playing with the server (W/M/LAMP)

- Test the server with the browser
- Copy an image into the server and open it with the browser
  - Path: /www (WAMP)
  - Path: /htdocs (MAMP)
- Create an index.html with “hello world” in that folder and open it with the browser
- See PhPMyAdmin
- Find config files for apache and mysql

Install REMUS

https://github.com/amador-duran-toro/remus
